

Probat presents revised Probatino

Emmerich on the Rhine, 23 September 2011: Probat, German-based specialist in designing and constructing roasting machines, has recently presented the next generation of its smallest shop roaster Probatino. The main focus of the development work was the continuation of the consistent concept, which made the roaster that successful in the past.

With its batch size of roughly one kilogramme the Probatino is used both in the laboratories of large coffee producers or in numerous small-scale specialty coffee roast houses. Green coffee traders rely as well on the constantly excellent quality and the reproducibility of the roasted product. These features are also decisive for the organisation "Cup of Excellence", which roasts its coffees on Probatinos worldwide.

The newly launched shop roaster now comes up with various modifications in detail which improve the ease of use. Additionally, installation and maintenance of the roasting machine were simplified. A sight glass in the discharging door permanently enables a visual monitoring of the roasting process. As with the shop roasters of the Probatone-series, the control panel is installed more ergonomic at the left side of the machine. All operator controls as well as the digital displays for roasting time and product temperature are directed to the roast master. Numerous improvements at the cooling sieve design enable a quicker and more comfortable discharging and cleaning. With regard to a simplified maintenance and installation, the pipe work was modified and inspection doors were enlarged.

The new Probatino is available from now in black/silver and black/brass. At Probat a specialised team (shop@probat.com, phone: +49 (0) 2822 912-550) is pleased to answer your questions or to provide you with additional materials. www.probat.com
